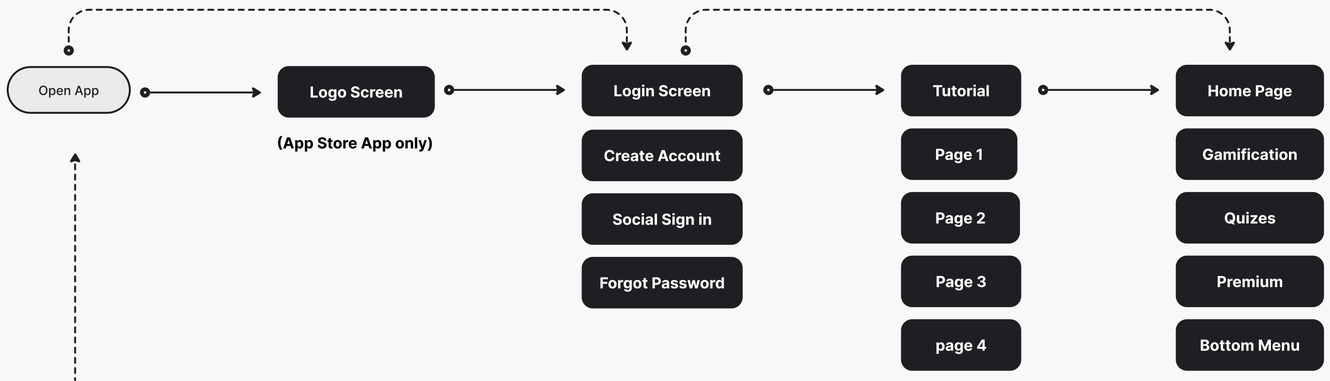
ARCHEFORGE

Web Application User Flow



Notes

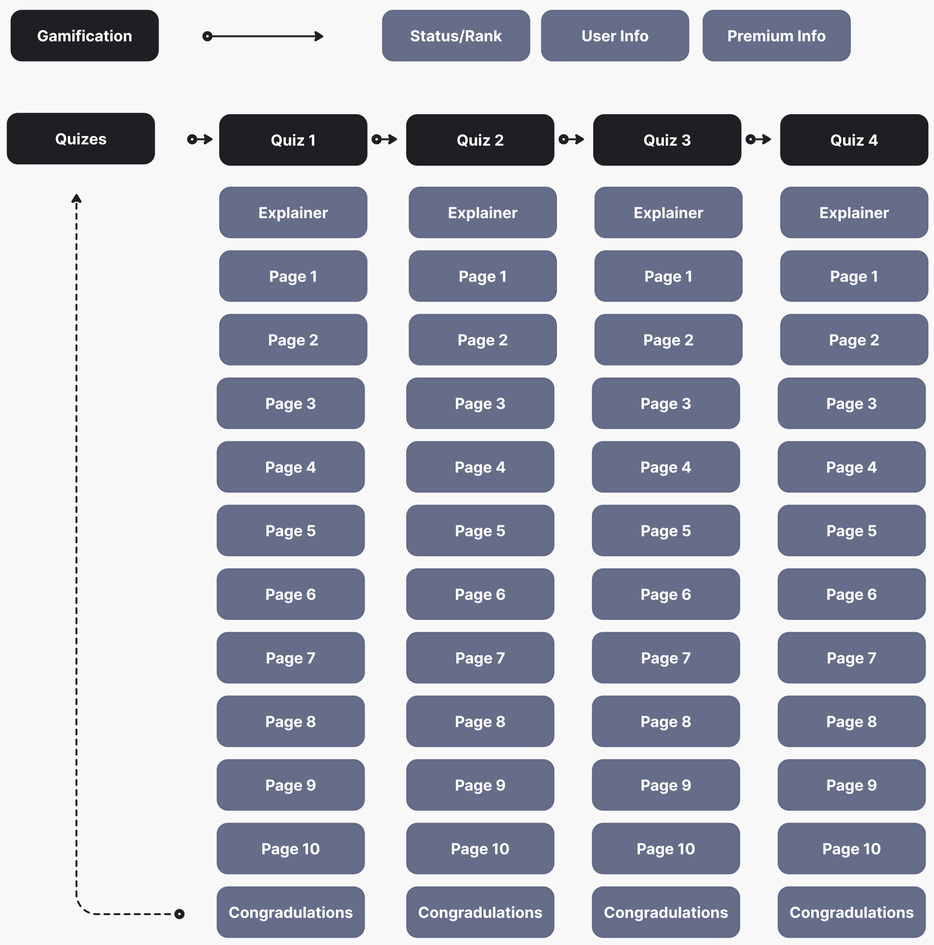
Login We need to make it dead simple to login using either your own email or a social login that gives the user security

The Tutorial will be out pitch to the users. It will likely be the pages used in the app store to show off the product later.

Home Page This will be our landing page that both keeps driving users to complete the quizzes, see their results, their progress, upgrade their account, access settings, see what information the app is using (transparency) and a way to delete some or all of that information.

For the Web app it will be our launching pad to other LLMS.

Home Page Sections and Drill downs



Future state

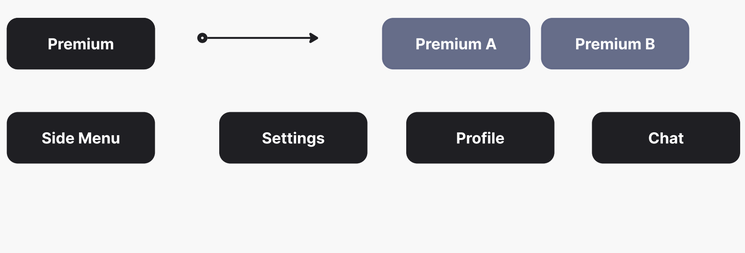
Notes

Feedback Quiz will be a critical element to our success. I will use it to improve the UX and make sure we are building our best product.

Future quizzes can help us refine our product.

Persona Quiz Will help us shape the persona to give us specified results. For example: A Business Assistant can be programed via the quiz with the right tone, approved language, fonts, colors, emotional feeling we want to convey to users and the feeling we want to target from users when they use this business product. We will shape the persona as much as we shaped our original assistant.

Personas will be a premium feature.



Notes

Side Menu This will allow the users to access their info, their profile, see Premium status, Cancel or Upgrade Premium status, and Delete their account.

This menu is subject to grow as we build and understand what needs to be added into it.

It will look like a hamburger menu on the web, and a bottom menu on the iOS/ Andriod App.

Chat While we are a web app, this page will let the users pick a LLM, when they click the Chat GPT button, the link will send them to Chat GPT with their unique hash that represents their Quiz results. This will open within the LLM as a 3rd party Application called (SoulPrint*). The Application will be able to use that hash code to give the user a better experience.

Note: ***I believe, most LLMs will require the User to reauthenticate with a new code every 24 hours.***
